Semester 1/2022**

## I. Ontology Question

### 1) What are the subclasses of Pizza?

- i. NamedPizza
- ii. UnclosedPizza

### 2) What are the classes that CheesyPizza is equivalent to?

- i. Pizza
- ii. hasTopping some CheeseTopping

### 3) What are the superclasses of CheesyVegetableTopping?

- i. VegetableTopping
- ii. CheeseTopping

### 4) What are the subclasses of SeafoodTopping

- i. PizzaTopping
- ii. hasSpiciness some Mild

### 5) Please interpret the meaning of InterestingPizza in plain English.

Any pizza that has at least 3 toppings. Note that this is a cardinality constraint on the hasTopping property and NOT a qualified cardinality constraint (QCR). A QCR would specify from which class the members in this relationship must be. eg has at least 3 toppings from PizzaTopping. This is currently not supported in OWL.

### 6) Please interpret the meaning of VegetarianPizza in plain English.

Any pizza that does not have fish topping and does not have meat topping is a VegetarianPizza. Note that instances of this class do not need to have any toppings at all.

### 7) Please interpret the meaning of MozzarellaTopping in plain English.

None

### 8) Please interpret the meaning of VegetarianPizza2 in plain English.

An alternative to VegetarianPizzaEquiv1 that does not require a definition of VegetarianTopping. Perhaps more difficult to maintain. Not equivalent to VegetarianPizza

### 9) Please interpret the meaning of IceCream in plain English.

A class to demonstrate mistakes made with setting a property domain. The property hasTopping has a domain of Pizza. This means that the reasoner can infer that all individuals using the hasTopping property must be of type Pizza. Because of the restriction on this class, all members of IceCream must use the hasTopping property, and therefore must also be members of Pizza. However, Pizza and IceCream are disjoint, so this causes an inconsistency. If they were not disjoint, IceCream would be inferred to be a subclass of Pizza.

### 10) What are the classes that disjoint with ArtichokeTopping?

- |                      |                     |
|----------------------|---------------------|
| i. ArtichokeTopping  | viii. OnionTopping  |
| ii. AsparagusTopping | ix. PepperTopping   |
| iii. CaperTopping    | x. PetitPoisTopping |
| iv. GarlicTopping    | xi. RocketTopping   |
| v. LeekTopping       | xii. SpinachTopping |
| vi. MushroomTopping  | xiii. TomatoTopping |
| vii. OliveTopping    |                     |

## II. Thai Pizza Ontology

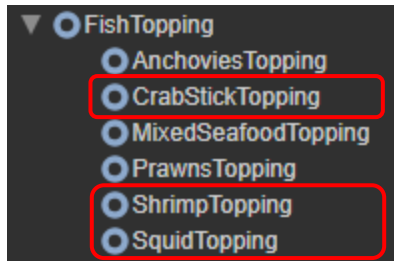

### a. Classes

This class is ThaiPizza class that is a subclass of Pizza representing the 3 Thai Pizza Styles including SeafoodPizza, SpicyChickenBarbecuePizza, and TomYumKungPizza as subclasses.

This class is ChickenTopping which is a subclass of MeatTopping. I added more subclasses including ChickenSausageTopping and NewOrleansChickenTopping.

This class is the FishTopping class which is a subclass of PizzaTopping. I added more classes that are toppings put on the ThaiPizza including CrabStickTopping, ShrimpTopping, and SquidTopping.

This class is the SauceTopping class which is a subclass of PizzaTopping. I added more classes including MarinaSauce, SpicyBarbecueSauce, and TomYumSauce.

This class is the PepperTopping class which is a subclass of PizzaTopping. I added more class which is CapsicumsTopping.

This class is the FruitTopping class which is a subclass of PizzaTopping. I added more class which is PineappleTopping class.

This last class is the Country class that I added the subclass which is the Shop class showing the shop in the country.

## b. Properties

I created an object property which is the hasShop property representing the shop where is in the country.

### c. Individuals

● Thailand The first individual I added is Thailand who is an individual in the Country class.

● PizzaCompanyShop The other 2 individuals I added are PizzaCompanyShop and PizzaHutShop  
● PizzaHutShop which are individuals of Shop class to represent a pizza shop.

### d. Relationships

Individual: PizzaCompanyShop

SauceTopping

Relationships  
hasSpiciness: Hot

The above images, shows the relation of SpicyBarbecueSauce and TomYumSauce classes with hasSpiciness to represent these sauces are hot.

The last class relationships are included as follows:

- 1) **SeafoodPizza** – The relationship contains `hasShop` with `PizzaCompanyShop` which represents this pizza style created by the Pizza Company Shop. Besides, it is related to `hasTopping` with all required toppings including `CapsicumsTopping`, `CrabStickTopping`, `MarinaraSauce`, `OnionTopping`, and `ShrimpTopping`.
- 2) **SpicyChickenBaebecuePizza** – The relationship contains `hasShop` with `PizzaHutShop` that represents this pizza is created by the Pizza Hut Shop. Besides, it is related to `hasTopping` with all required toppings including `CheeseTopping`, `NewOrleansChickenTopping`, `PineappleTopping`, `SpicyBarbecueSauce`, and `ChickenSausageTopping`. Because of `NewOrleansChickenTopping`, `ChickenSausageTopping`, and `SpicyBarbecueSauce` that had a relation with `Spiciness` class, this pizza will have a spicy taste.
- 3) **TomYumKungPizza** – The relationship contains `hasShop` with `PizzaCompanyShop` that represents this pizza is created by the Pizza Company Shop. Besides, it is related to `hasTopping` with all required toppings including `MushroomTopping`, `ShrimpTopping`, `SquidTopping`, and `TomYumSauce`. Because of `MushroomTopping` and `TomYumKungSauce` had a relation with the `Spiciness` class, this pizza will have a spicy test.

According to the above relationship, you will see the shop where all pizzas are created. All shops are related to the `hasCountryOfOrigin` property with `Thailand` individual, so it could be said all pizza shops are established in Thailand.
